Dental benefits: from engagement to claims-confirmed follow-through

A collaboration proposal for Snowflake Healthcare & Life Sciences

Attention: Todd Crosslin, VP & Global Head, Healthcare & Life Sciences · Harsha Kapre, Director, Product Management

From: Jangwoo Kim, ICLO Corp. · **Date:** September 8, 2026 · v15 · For discussion

---

Todd, Harsha —

We are asking for one 60-minute working session, not an introduction round.

ICLO is building an employee dental-benefit navigation service and a claims-confirmed evidence layer behind it. The front end helps an employee understand eligibility, plan rules and network context, prepare for care, and request provider search or appointment support. The back end connects that journey to eligibility and dental claims so an employer can see aggregate, claims-confirmed evidence — not individual health information.

We believe Snowflake is the governed evidence and collaboration plane for that workflow. We do not yet have the evidence to assert it. This proposal states what we would need to prove, what we would need from HLS to prove it, and the conditions under which we would stop.

Three things we are asking of you:

1. Agreement on the most natural HLS sales play for this workload — application, or evidence layer.
2. A sponsored technical working session with a named HLS architect and solution engineer.
3. An account-by-account path to determine whether a payer or TPA actually holds dental eligibility or claim-line data in Snowflake.

We are not asking for generic customer introductions. We want to learn what ICLO must prove before an account team or partner program would support us.

---

1. The decision a benefits team cannot make today

A benefits team needs more than app-open counts. It needs evidence to decide **whether engagement is followed by actual care, where follow-through breaks down, and where to direct the next operating budget**.

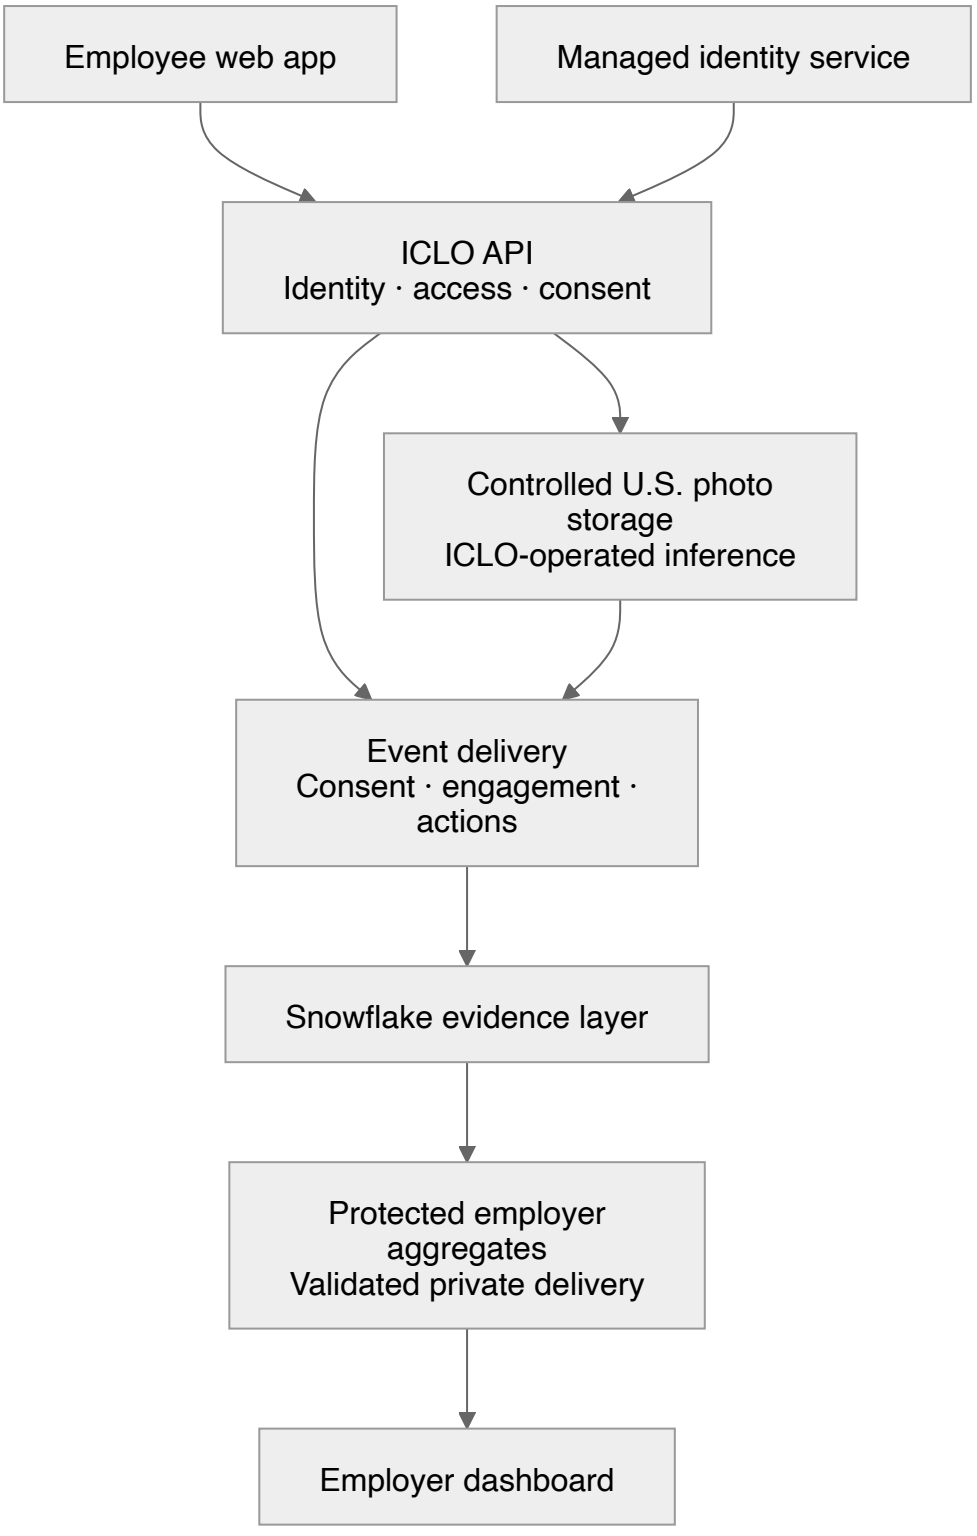

The records exist but sit apart. Eligibility files identify the covered population. App records describe participation and recommendations. TPA claims record care utilization. Our buyer hypothesis is that linking those records to the same person and period creates decision-grade evidence that neither existing TPA reporting nor broker renewal material provides.

That is a hypothesis, and we say so plainly. Reporting capability and frequency vary by employer; we do not assume employers are limited to annual cost reports. **As of September 8, 2026, our repository contains no recorded U.S. buyer problem-validation interviews.** Closing that gap is our work, not Snowflake's.

The initial target is an employer with a self-funded dental plan, where the employer funds the plan and a TPA/ASO administers claims, so utilization change and plan-paid amounts can be examined together.

What we are not promising. More visits may raise near-term claims costs. Utilization and plan-paid claims may rise before any longer-term treatment-mix change becomes measurable. We do not promise first-year savings, ROI, or causal health improvement. The initial value proposition is better program operating decisions.

2. Architecture: where the boundary sits

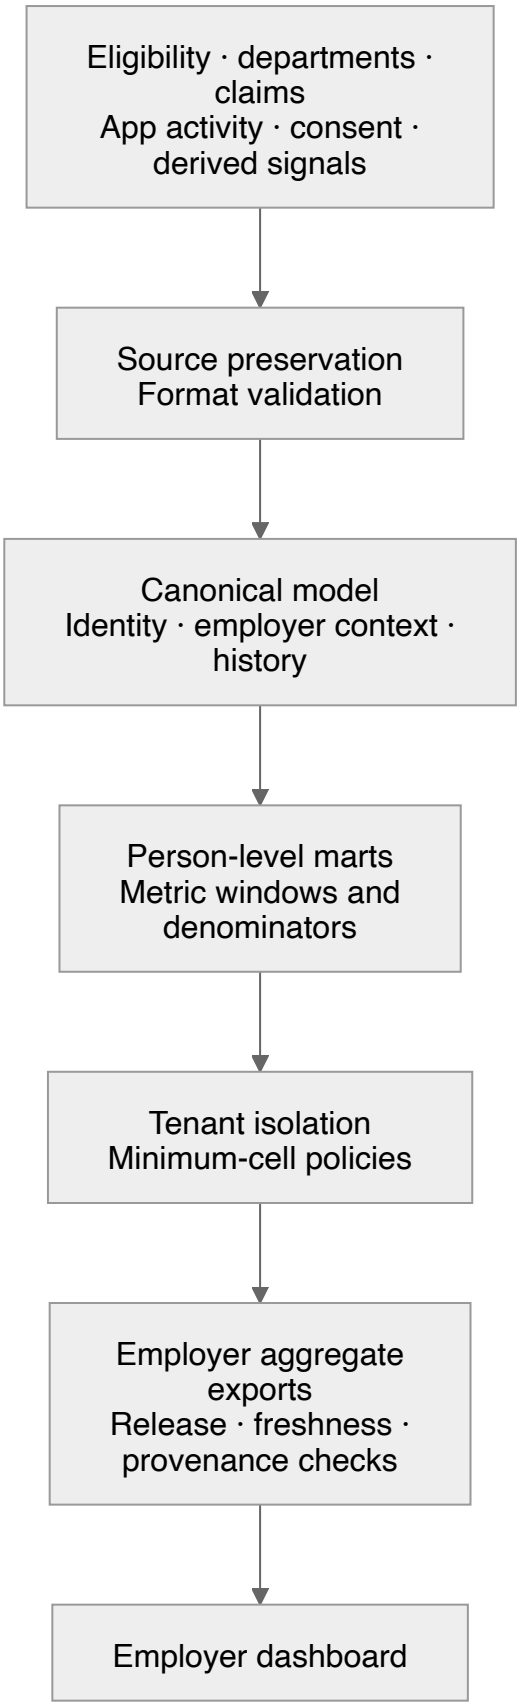

Structured eligibility, plan context, app events and claims go to Snowflake. Raw oral images stay outside Snowflake, in ICLO-controlled storage in a U.S. region; only references and derived signals cross the boundary. Browsers never hold Snowflake credentials or query raw

personal records.

Individual results and employer aggregates have separate access boundaries. Both employee and employer surfaces use Low, Moderate and Priority bands and display no numeric scores; the band is presented as a wellness signal, not a clinical finding or medical advice. Oral-image capture is optional, and early model outputs remain in shadow mode — they do not automatically determine urgency, provider choice or treatment pathway.

One deliberate restriction: the service must not compute a member's remaining benefit balance by summing delayed warehouse claims. If the TPA cannot supply current authoritative figures, the balance stays blank and the member is routed to the official inquiry channel.

3. Data flow and the suppression rule

Input	Provider and purpose
Eligibility	Employer or benefits administrator; X12 834 or agreed file establishes who is eligible and when
Department history	Separate employer HRIS file establishes department assignment at the reporting date
Claims and remittance	TPA/ASO; X12 837D and 835 or agreed extracts provide service dates, adjustments and plan-paid amounts
App and inference records	ICLO app and directly operated Core AI provide events, consent and derived signals

The minimum cell is **20 distinct people** — not 20 monthly rows and not 20 claim lines. Counts, percentages and bars below that threshold are withheld together, with an explanation, and the design addresses neighboring-cell comparisons that could reveal an individual. These are ICLO design requirements, not demonstrated database enforcement, and not a guarantee against all re-identification.

4. The three technical questions for your team

Snowflake positions its healthcare and payer platform around connecting multiple sources and enabling collaboration. We propose a specific application of that foundation. The assessment reduces to three questions we cannot answer without you.

1. **Source connectivity.** Where the TPA and account configuration allow, assess Secure Data Sharing. Same-region sharing gives access without copying the source, though our derived tables and exports still create separate data. Cross-region or cross-cloud delivery may require additional sharing or replication. Data-use rights must be established contractually in every case.
2. **Tenant isolation and aggregation controls.** Test row access policies and aggregation policies together in a real account. An `ENTITY KEY` lets the minimum group size count a person once even when their records span many rows.
3. **Operating evidence.** Establish access records and provenance that support monthly reprocessing and reproducible reporting. Snowflake Access History is necessary but not sufficient; ICLO must connect application, storage, authentication and inference audit records to it.

Business Critical and an appropriate BAA are platform prerequisites for handling PHI in Snowflake. They do not by themselves make ICLO HIPAA-compliant, and we are not asking Snowflake to make legal, FDA or HIPAA determinations for us.

Native Apps, Data Clean Rooms and federated learning are plausible later steps. None is a requirement for the employer pilot, and we are not presenting them as one.

5. What we would measure

Observation	Interpretation rule
Participation	Reporting-month eligible employees who completed registration and first questionnaire
Valid capture	People meeting quality conditions; repeated uploads do not become additional people
Repeat participation and band distribution	12 months including reporting month; distribution uses each person's latest valid capture
Open actions	Actions still open and within their action window at the reporting date
Claims-confirmed completion	Actions in a mature cohort confirmed by a HIGH-confidence claims match
Cost and freshness	Allowed amount per member-month, plan-paid and member out-of-pocket kept separate; claims-through date kept separate from file delivery time

Open backlog and mature-cohort completions are separate measures — dividing one by the other does not produce a completion rate. An absent claim is not automatically an absent visit. Completion measures stay provisional until claims lag is measured. Evidence of a visit does not establish that the program caused it.

The 250-employee screening threshold is not sufficient on its own. Partner qualification must also assess distinct contributors to each key outcome, the observation period, and what remains reportable after suppression. If those fail, we shorten scope or extend the period; the minimum-cell policy is not the thing that moves.

6. Stages, and the conditions to stop

FIRST 90 DAYS — VALIDATE THE RELATIONSHIP AND DESIGN

Period	Work	Evidence retained
Days 1–30	Connect U.S. HLS and architecture contacts; assess candidates and existing reporting workflows	Written follow-up, buyer problem and decision-maker, validation scope and owners
Days 31–60	Assess software and data boundaries, source rights, identity linkage, control-test design	Agreed design scope; owner and closure path per open item
Days 61–90	Assess candidate data and operating fit; aim to select one future PoC partner	Written proceed / revise / stop decision with scope, budget, schedule

Real-data loading, a completed service and measured dental PoC outcomes are **not** deliverables of this period.

THEN A3 — EXECUTION ON SYNTHETIC DATA

Three synthetic employers, 36 months of inputs, run through actual Snowflake transformations and policies. Test cross-tenant access, aggregation below 20 distinct people, mixed export releases, retroactive corrections and reruns. Local SQL checks do not substitute for this.

THEN A2 — REAL DATA AND LIVE OPERATIONS

Condition	What must be established in writing
HIPAA roles	Roles of ICLO, employer health plan, TPA, Snowflake and others, including required BAAs
Data rights	Permission to receive and use each source, field and purpose
Baseline load before consent	Lawful basis for records arriving before consent, and for nonparticipants
Common identity key	Stable linkage across eligibility, app and claims records, with exception handling
State health-information law (CA CMIA first)	Applicable requirements and consent/operating conditions, assessed separately from HIPAA

Stop criteria. Work does not proceed if no partner candidate is available, required data rights cannot be secured, or the required region configuration is unavailable. If buyers cannot identify incremental value over current reporting, or key results cannot be reported safely after suppression, we reassess scope before expanding implementation.

7. Responsibilities

Party	Proposed responsibility
ICLO	Product and metric contracts, app/inference integration, pipeline implementation, quality and access controls, operations and validation evidence
Snowflake HLS	U.S. routing, architecture-contact connection, technical input on data controls, consideration of suitable candidate introductions
PoC partner and TPA/ASO	Buyer-problem validation, authorized source provision, agreement on data rights, identifiers and claims interpretation
Each party's legal and security owners	Written determinations on actual processing scope and start conditions

This allocation is proposed. No Snowflake staffing or introduction is assumed committed. Scope assessment will account for ICLO service fees, TPA extraction and delivery charges, cloud consumption, legal and security costs, and internal staff time. **This document is not a quotation.**

If validation succeeds, the commercial value to Snowflake is a repeatable healthcare data use case and a basis for assessing subsequent opportunities. We are not presenting a small synthetic exercise as a large consumption opportunity.

Current state, stated once. Employee and employer screens run on **synthetic data — illustrative only**. Backend services, real authentication, server-side consent enforcement, photo storage, the Core AI request path and actual Snowflake policy execution remain to be built or validated. Synthetic participation and cost figures are not results or forecasts.

8. The ask

A **60-minute working session** with a U.S. HLS contact and a solution architect. ICLO brings this proposal, the detailed architecture annex, a local synthetic demo and a source-data request outline.

Requested outputs:

- One written follow-up naming responsible U.S. HLS and technical contacts.

- Whether introductions to three self-funded dental-plan employer candidates are feasible, and the next step. Broker- or consultant-led introductions count.
- Scope and owners for data-control tests on synthetic inputs.
- Next meeting date, owners of open items, and the evidence required for the stage decision.

One optional diligence question, offered without any assumption of fit: would Snowflake's own employee-benefits organization be relevant as a design-partner candidate, subject to funding structure and data-rights verification?

The first result of this collaboration would be an agreed customer problem and a data, access and measurement structure capable of answering it.

Thank you for the read.

Jangwoo Kim · ICLO Corp. · jw.kim@iclocorp.com

DOCUMENT NOTE

Korean and English editions carry the same scope, requests and start conditions. The accompanying **Software and Data Architecture** annex holds the detailed design. This document reflects the repository's contract, product requirements and execution architecture as inspected on September 8, 2026. ICLO design proposals are distinguished throughout from verified implementation.
