

ICLO x Snowflake

Building the Evidence Layer for Employer Dental Benefits

ICLO turns employee dental-benefit navigation into claims-confirmed, privacy-governed evidence.

The Employee Problem Is Not Coverage Alone - It Is Navigation

Plan, network and operational context shape whether coverage becomes usable care.

NETWORK

Provider choice may be constrained or economically penalized by plan rules.

BENEFIT DESIGN

Deductible, coinsurance, annual maximum and covered procedures vary.

OPERATIONS

Directory status, appointment availability and final EOB may differ from expectations.

ICLO Connects Plan Context to Employee-Initiated Action

Employee dental-benefit navigation in the front; a governed evidence layer in the back.

SHADOW SIGNAL

Raw disease probabilities are not shown to employees or employers. Model-derived signals do not automatically determine provider, urgency or treatment pathway.

Provisional ICLO redline pending U.S. regulatory counsel: keep signal, navigation and referral events separate; record employee action and consent timestamps.

UNDERSTAND
Concerns, benefits and optional image capture.

MATCH
Eligibility, plan, network and operational context.

VERIFY
Preventive visits and claims at aggregate employer level.

The Economics Begin with a J-Curve, Not a Year-One Savings Promise

Year-one utilization and plan-paid claims may rise before treatment-mix change becomes measurable.

Illustrative shape only - not an ICLO outcome

UTILIZATION

Preventive use can raise plan-paid claims.

COST ALLOCATION

Allowed, plan-paid and employee OOP can move differently.

CONTRACT PRINCIPLE

ICLO will not contract on a year-one savings guarantee.

Snowflake Is the Governed Evidence Plane

Structured evidence is governed in Snowflake; raw images and employee-level routing remain outside employer views.

The Dashboard Makes Privacy and Data Quality Visible

This is not a performance claim. It shows how denominator, freshness, privacy and claims completeness become visible to the buyer.

- 1 Synthetic label
- 2 Employee / member lenses
- 3 Eligibility + claims dates and lag
- 4 Completeness indicator
- 5 Aggregate only + n >= 20 + no PHI

The inset shows the policy firing for a 14-person group.

The Opportunity Is Account-Specific - Not "Delta" or "Blue" as a Whole

Procurement, workloads and incumbents must be validated at the legal-entity and business-unit level.

Delta Dental: 39 independent companies

Blue Cross Blue Shield: 33 independent, locally operated companies

Organization / unit	Public incumbent signal	Dental data in Snowflake	Potential ICLO whitespace
Delta Dental of Washington	Dentistry.One	VALIDATE	VALIDATE
Delta Dental of California / relevant unit	Toothpic / quip (historical)	VALIDATE	VALIDATE
BCBS Massachusetts	Teledentistry.com; Toothpic (historical)	VALIDATE	VALIDATE

No Snowflake dental workload is assumed. Public vendor presence does not prove enterprise-wide capability or eliminate ICLO whitespace.

What We Need from Snowflake GTM

We need industry fit, internal coordination and account-path sponsorship - not generic introductions.

01 FIT

Which HLS sales play fits naturally: payer claims analytics, benefits navigation, healthtech applications or secure collaboration?

02 PEOPLE

Name the HLS architect, solution engineer, security/compliance owner and startup/partner lead.

03 ACCOUNTS

Select one payer/TPA account team to validate dental data and unmet need before any introduction.

04 PATH

Provide written credits/support scope and readiness criteria for partner, co-sell and application paths.

Not asking Snowflake for: legal opinions, compliance certification, generic customer introductions or a savings guarantee.

A 90-Day Joint Validation Plan

The outcome is a validated architecture and one account-team use-case review, not a co-sell commitment.

We are not asking Snowflake to validate our dental AI or make ICLO compliant. We are asking Snowflake to help us determine whether this can become a repeatable, governed payer/TPA data-collaboration pattern - and what ICLO must prove to make that partnership commercially real.

Data and Responsibility Matrix

Platform responsibility, operating responsibility and legal judgment remain separate.

Domain	ICLO	Employer / TPA / partner	Snowflake	Outside Snowflake scope
Employee navigation	Product, events, consent UX	Employee action; operational support	Govern event data by purpose	Licensure / referral-law analysis
Eligibility + plan + network	Map and use context	Provide under contract	Canonical model + reconciliation	Data-rights determination
Claims + outcomes	Attribution logic	Claims, run-out, completion	Aggregate calculation + access	Savings validation
Raw images + models	Vault, inference, validation	Clinical role as applicable	URI + metadata + approved signal	Model endpoint validation
Governance + compliance	App controls + incident operations	Source-system controls	RBAC, masking, row policy, history	ICLO-wide compliance conclusion

Detailed Snowflake Technical Questions

Resolve the pilot pattern first; treat application packaging and multi-party ML as conditional.

PRIORITY NOW

- 1 What is the practical U.S. account, cloud/region, Business Critical and BAA path?
- 2 When should we use same-region Direct Share versus controlled SFTP/API staging?
- 3 What tenancy, purpose-access, masking, row-policy and access-history pattern do you recommend?
- 4 How should we size 2.5K / 10K / 25K populations and measure post-credit unit economics?
- 5 What must ICLO prove for startup, partner, Powered by Snowflake or co-sell readiness?

CONDITIONAL / LATER

Native App

When does customer-account execution create repeatability beyond a connector pattern?

Clean Room

What real multi-party payer / TPA / employer collaboration would justify it?

Federated learning

Does this mean true local training and parameter aggregation, or collaborative ML inside a Clean Room, Native App or customer-account execution pattern?

Not required for the first employer pilot.

Employer J-Curve Simulation - Inputs and Outputs

A governed planning heuristic should expose assumptions, scenario versions and uncertainty.

Planning heuristic - calibrate with customer data; not an ICLO outcome.

Named-Account Diligence Template

Replace market-level assumptions with legal-entity, workload and readiness evidence.

ACCOUNT IDENTITY + DATA

Organization / legal entity	Account type	Self-funded dental admin?	Dental eligibility in Snowflake?	Claim-line data in Snowflake?	Cloud / region

COMMERCIAL + TECHNICAL READINESS

Current navigation / teledentistry vendor	Potential ICLO whitespace	Snowflake account owner	Technical validation ready?	Customer introduction ready?

No statement that 'many TPAs are on Snowflake' should be used before this matrix contains account evidence.
