

U.S. Self-Funded Employer Dental-Benefit PoC

This proposal converts ICLO's existing Snowflake startup support into a structured 90-day joint validation.

Employee navigation

Understand coverage
Find care + request support

Claims-verified evidence layer

Eligibility + plan + network
App events + dental claims

Employer decisions

Plan + administrator fit
Access + claims + OOP

Four Decisions Stand Between Coverage and Care

A dental benefit becomes usable only after four separate decisions are resolved.

The product reduces decision friction; it does not expose raw clinical probabilities.

From Dental Benefit to Verified Use

Navigation in front; a governed, claims-verified evidence layer in back.

SHADOW SIGNAL

Raw disease probabilities are not shown to employees or employers. Model-derived signals do not automatically determine provider, urgency or treatment pathway.

Design redline: separate signal, navigation and referral tables; timestamp employee action and consent.

One U.S. Dental-Benefit Lane

The U.S. market contains multiple funding models; this proposal validates only self-funded employer dental benefits.

Lens	Korea baseline	U.S. market	This PoC	Why it matters
Coverage base	NHIS-centered; dental is partly supplemental	Dental benefit may be a separate plan	Employer-sponsored dental	Rights and data paths differ
Funding risk	Not this proposal's comparator	Fully insured, self-funded, public and individual coexist	Employer funds dental claims	Employer has a direct stake
Administration	National operating context differs	Carrier/TPA may run eligibility, network and claims	One administrator lane	Cooperation is required
Employee task	Coverage and price questions	Network, plan rules, OOP and availability	Employees + dependents	Benefit must become usable care
Evidence	Not assumed comparable	Data sit across employer, administrator and providers	Aggregate employer evidence	No employee-level PHI in employer views

The U.S. Dental-Benefit Operating Chain

Funding arrangement, administrator, beneficiary and claim path are separate questions; the PoC covers one specific lane.

CURRENT POC SCOPE: U.S. SELF-FUNDED EMPLOYER + DENTAL CARRIER/TPA + EMPLOYEES/DEPENDENTS

The Governed Evidence Layer Runs on Snowflake

Structured evidence can be governed in Snowflake; raw images and employee-level routing stay outside employer views.

RAW-IMAGE PATH

Raw oral image

Controlled U.S. object
storage / PHI vault

Shadow inference

No image binaries. Person-
linked references and
signals do enter

STRUCTURED EVIDENCE PATH

App events

HRIS eligibility

Plan + provider
context

TPA / carrier claims

Snowflake U.S. governed evidence layer

Canonical model

member-month + plan + event
+ claim

Quality + controls

reconciliation + purpose access
+ lineage

Outcome layer

claims-confirmed outcomes (arm
assignment pending legal + protocol
sign-off)

Employer aggregate dashboard

No employee-level health signals or routing

For PHI in Snowflake: Business Critical + executed BAA are platform prerequisites - not ICLO-wide HIPAA compliance.

Year One May Cost More

Year-one utilization and dental plan-paid claims may rise before treatment-mix change becomes measurable.

Illustrative shape only - not an ICLO outcome

UTILIZATION Preventive use can raise plan-paid claims.	COST ALLOCATION Allowed, plan-paid and employee OOP can move differently.	CONTRACT PRINCIPLE ICLO will not contract on a year-one savings guarantee.
--	---	--

What the Buyer Can Verify

Not a performance claim: the denominator, freshness, claims lag and privacy rules stay visible.

SYNTHETIC

Illustrative only

DENOMINATOR

Employees / members

FRESHNESS

Dates + claims lag

PRIVACY

Aggregate only · min cell by distinct person · employer isolation

Route the Existing Support Relationship

Step 0 is routing: the current Korea startup sponsor names the U.S. HLS GTM and architecture owners before technical work begins.

STEP 0 ROUTE	Confirm the official support-program name; the current Korea sponsor routes ICLO to U.S. HLS GTM and architecture.
FIT + PEOPLE	Confirm the primary sales play and name the HLS architect, SE, security/compliance and startup/partner leads.
ACCOUNT	Complete one account diligence row by Day 30; run a separate account-team use-case review by Day 75.
PATH	Document account/region/BAA, credits/support and partner/co-sell readiness criteria.

Not asking Snowflake for: legal opinions, compliance certification, generic customer introductions or a savings guarantee.

A 90-Day Validation Plan · Route and Design

Step 0 through Day 60: name the owners, then design the architecture.

STEP 0 + DAYS 0-30 ROUTE + ALIGN

SNOWFLAKE

Route to HLS; confirm play, owners and the U.S. account / BAA path.

ICLO

Provide current-state pack; run workshop and cadence.

GATE · Sponsor, owners and route in writing

DAYS 31-60 DESIGN

SNOWFLAKE

Size workload; co-draft the security reference and account matrix.

ICLO

Provide source map, ingestion test and sizing inputs.

GATE · Architecture + matrix v1 accepted

A 90-Day Validation Plan · Validate and Expand

Day 61 to Day 90, plus conditional expansion. ICLO owns the cadence and decision log.

DAYS 61-90 VALIDATE

SNOWFLAKE

Sponsor one account-team review; issue the partner-readiness checklist.

ICLO

Run review; recommend go / no-go.

GATE · Use case + evidence minimum agreed

CONDITIONAL EXPAND

SNOWFLAKE

Assess Native App, Clean Room or federated learning only if needed.

ICLO

Build only after multi-party demand is confirmed.

TRIGGER · Account review confirms multi-party need

OPERATING MODEL · ICLO runs weekly written status and one decision log.

CONSUMPTION MODEL · ICLO supplies the sizing inputs (employers, member-months, ingestion / transform / outcome-refresh frequency, data volume, warehouse size and runtime); the Snowflake SE calculates annual credits in the Day-30 sizing session.

Data and Responsibility Boundaries

Platform responsibility, operating responsibility and legal judgment remain separate.

Domain	ICLO	Employer / TPA / partner	Snowflake	Outside Snowflake scope
Employee navigation	Product, events, consent UX	Employee action; operational support	Enforce purpose-based access on event data	Licensure / referral-law analysis
Eligibility + plan + network	Map and use context	Provide under contract	Canonical model + reconciliation	Data-rights determination
Claims + outcomes	Attribution logic	Claims, run-out, completion	Aggregate calculation + access	Savings validation
Raw images + models	Vault, inference, validation	Clinical role as applicable	URI + metadata + approved signal	Model endpoint validation
Governance + compliance	App controls + incident operations	Source-system controls	RBAC, masking, row policy, history	ICLO-wide compliance conclusion

Technical Decisions for the Pilot

Resolve the pilot pattern first; treat application packaging and multi-party ML as conditional.

PRIORITY NOW

- 1 What is the practical U.S. Business Critical and BAA path for ICLO's current Snowflake account?
- 2 When should we use same-region Direct Share versus controlled SFTP/API staging?
- 3 What tenancy, masking, row-policy and access-history pattern do you recommend?
- 4 How should we size 2.5K / 10K / 25K populations and measure post-credit unit economics?
- 5 What must ICLO prove for startup, partner, Powered by Snowflake or co-sell readiness?

CONDITIONAL / LATER

Native App

When does customer-account execution beat a connector pattern?

Clean Room

Which multi-party payer / TPA / employer collaboration justifies it?

Federated learning

True local training with parameter aggregation, or collaborative ML in a Clean Room, Native App or customer account?

Not required for the first employer pilot.

What the Scenario Model Needs

A governed planning heuristic should expose assumptions, scenario versions and uncertainty.

Planning heuristic - calibrate with customer data; not an ICLO outcome.

Account Evidence Required Before Outreach

Validate the employer, dental administrator, data workload, rights and technical readiness account by account.

ACCOUNT IDENTITY + DATA

Organization / legal entity	Account type	Self-funded dental admin?	Dental eligibility in Snowflake?	Claim-line data in Snowflake?	Cloud / region

COMMERCIAL + TECHNICAL READINESS

Current navigation / teledentistry vendor	Potential ICLO whitespace	Snowflake account owner	Technical validation ready?	Customer introduction ready?

Blank template, to be completed with the account team. No statement that 'many TPAs are on Snowflake' should be used before this matrix contains account evidence.

ICLO: Confirmed and Still to Verify

Program selections and a defined product/data boundary support validation; current Snowflake status must be confirmed before release.

ICLO AT A GLANCE

- 1** COMPANY
ICLO Co., Ltd. · Jeju, Republic of Korea · Commercial in the Korean market, B2C and B2B · 12 core team
- 2** PRODUCT
HomeDen SaaS (PMS / EMR / CRM) plus employer dental-benefit navigation and claims-evidence design
- 3** PROGRAMS
Selected: Fintech Cube Cohort 9; Shinhan Future's Lab Cohort 12
- 4** SNOWFLAKE STATUS
To confirm with Snowflake: official program name, sponsor, account, cloud, region, credits and support owner
- 5** NEXT PROOF
One U.S. self-funded employer dental-data path plus one account-team review

The Snowflake row is the ask in this meeting. Korean commercial stage and program selection do not prove insurer integration, underwriting, adjudication or U.S. outcomes.
